

# SEO Audit Report

[www.dr-webstudio.com](http://www.dr-webstudio.com)

**SEO Health Score: 76 / 100** — Strong technical foundation,  
held back by data-integrity and entity-consistency defects

Full-site audit & 216-URL coverage sweep · July 9, 2026

DR Web Studio — Web Development, Punta Cana, Dominican Republic

Methodology: claude-seo v2.2.0 — 10 parallel specialist analyses + scripted full crawl

# Executive Summary

dr-webstudio.com scores **76/100**. The rendering and crawl infrastructure is excellent — fully server-rendered content, a clean 216-URL sitemap with complete hreflang alternates, crawler-safe locale redirects, IndexNow push indexing, AVIF images, and near-zero layout shift. Spanish/English content parity is excellent across all 108 page pairs.

What limits the score is **self-contradiction and entity fragmentation**: the site publishes two different prices for the same package, two different project counts, and structured data whose identifiers point at the wrong locale's URLs on 78+ pages. These are precisely the defects that erode trust with Google's quality systems and cause AI search engines to cite wrong facts about the business.

Backlinks: INSUFFICIENT DATA at free tier (no Moz/DataForSEO key) — 10/10 client credit links verified live & dofollow. Performance is single-run Lighthouse lab data (no CrUX field data — Google API key not configured).

## Top 5 actions by impact

| # | Priority | Action                                                                                                                                                                              | Why it matters                                               |
|---|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------|
| 1 | CRITICAL | Fix blog structured data: <code>mainEntityOfPage</code> uses stale/wrong-locale slugs on <b>54 of 132 posts</b> ; author is Organization instead of James Karnes on <b>98 posts</b> | Google/AI conflate EN & ES articles; lost authorship E-E-A-T |
| 2 | CRITICAL | Reconcile pricing: \$800 (pricing-page schema) vs \$950 (org schema + visible copy) for the same Business package; unify the package name                                           | AI engines may quote either price                            |
| 3 | CRITICAL | Build a dedicated freelance-hire landing page (en+es) — hire-intent queries currently rank the 337-word About bio against marketplace-dominated SERPs                               | Highest-value commercial intent unserved                     |
| 4 | HIGH     | Localize schema <code>@id</code> s (24 pages emit wrong-locale identifiers) and reference the Organization by <code>@id</code> on all 32 landing pages                              | Entity consolidation across the site graph                   |
| 5 | HIGH     | Add WhatsApp ( <code>wa.me</code> ) and <code>tel:</code> CTAs sitewide; enforce the Content-Security-Policy (currently Report-Only)                                                | #1 conversion gap in the DR market; open security item       |

# Critical Findings

## C1 · Blog structured data points at the wrong article 54 / 132 posts

Verified by full crawl: 44 of 66 English posts declare `Article.mainEntityOfPage` = the *Spanish* slug under `/en/`, contradicting each page's own canonical tag. 10 of 66 Spanish posts point at *stale, retired slugs* — one even at an `/en/` URL. 22 EN posts (the newer ones) are clean, which localizes the defect to older posts' schema generation.

**Example:** `/en/blog/why-your-punta-cana-business-doesn-t-appear-on-google-maps...` declares `mainEntityOfPage: /en/blog/por-que-negocio-punta-cana-no-aparece-google-maps...`  
**Fix check:** re-crawl any affected post; `mainEntityOfPage.@id` must equal the canonical URL. **Leading indicator:** GSC impressions for EN blog URLs.

## C2 · The site publishes two prices for the same package Data integrity

The pricing page's own `OfferCatalog` JSON-LD lists "Business Website Package" at **\$800**; the organization-wide catalog and the visible page copy list "Custom Business Websites" at **\$950**. Same offer, two names, two prices — an AI assistant answering "how much does DR Web Studio charge?" can surface either. A single source of truth (code constant or Sanity document, not both) is required.

## C3 · Hire-a-freelancer intent lands on a 337-word bio Strategic gap

For "freelance web developer dominican republic" (EN and ES variants), the ranking page is `/en/about-me` — against SERPs ~90% dominated by marketplaces (Upwork, Workana, Twine) and comparison listicles. A competitor's dedicated page proves an individual brand can rank here. Recommended: purpose-built `/en/hire-freelance-web-developer-dominican-republic` (+ES) reusing the pillar template — portfolio-first, pricing above the fold, freelancer-vs-agency framing, WhatsApp CTA.

# High-Priority Findings (fix within 1 week)

| #  | Finding                                                                                                                                                                                                                                              | Evidence / location                                             |
|----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| H1 | <b>CSP not enforced</b> — only <code>Content-Security-Policy-Report-Only</code> is served; the site has no active XSS/injection protection. Console shows the policy has been in report-only since June.                                             | <code>next.config.ts:159</code> ; verified via response headers |
| H2 | <b>Corrupted title &amp; meta description</b> on a money page: literal <code>&amp;quot;</code> ; wraps the title of the EN Santo Domingo page (ES sibling clean). Sitewide sweep confirms this is the only affected page.                            | <code>/en/web-design-santo-domingo</code> — Sanity SEO field    |
| H3 | <b>Conflicting experience claims:</b> footer "50+ Projects Completed" vs About page "25+ Websites Delivered" (About page not wired to the single-sourced <code>trustSignals.stats</code> ).                                                          | Homepage footer vs <code>/en/about-me</code>                    |
| H4 | <b>3-hop apex redirect chain</b> with a temporary 307 mid-chain where canonical host consolidation happens: <code>http://dr-webstudio.com</code> → apex-https (307) → <code>www</code> → <code>/es</code> . Should be one permanent hop at the edge. | Vercel domain configuration                                     |

|     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                          |
|-----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| H5  | <b>Schema @id fragmentation, 3 patterns / 1 root cause:</b> (a) trailing-slash mismatch between homepage OfferCatalog and all 9 Service pages; (b) <b>24 pages emit wrong-locale @ids</b> (ES service/portfolio/FAQ/about pages carry internal-English-route @ids like /es/our-services/...; EN pillar & city pages carry ES-slug @ids); (c) all <b>32 landing pages</b> declare Service.provider as an inline duplicate Organization instead of an @id reference. Plus duplicate WebPage+CollectionPage nodes on /blog. | src/lib/schema/nodes.ts (~322), graph.ts; @id built without localizedUrl |
| H6  | <b>No WhatsApp or click-to-call anywhere</b> — 0 wa.me / tel: links across all checked pages despite the phone in schema. WhatsApp is the default business-contact channel in the DR; every persona analysis flagged this as the top conversion blocker.                                                                                                                                                                                                                                                                 | All templates (header, contact, pillar pages)                            |
| H7  | <b>Thin money pages:</b> homepage ~259–310 words of main content (below the 500-word floor), pricing 476/575, contact 485/583 — the two highest-intent pages are the thinnest. None of about/contact/pricing/portfolio has a single H2 (H1 jumps to H3).                                                                                                                                                                                                                                                                 | Both locales; full-crawl word counts                                     |
| H8  | <b>Homepage LCP 3.0–3.1 s (lab)</b> — image already optimal (AVIF, fetchpriority=high); the delay is main-thread contention (ES: 668 ms element render delay). Contributors: ~80 KB mostly-unused vendor chunks, 21 KB legacy polyfills, 200–370 KB background link-prefetch fan-out per page.                                                                                                                                                                                                                           | Lighthouse 13.4, mobile throttling                                       |
| H9  | <b>Client-site defect visible to prospects:</b> grandbay-puntacana.com (portfolio client) has its <title> set to "DR Web Studio – Custom Web Design..." — hurting the client's SEO and discoverable by anyone researching the portfolio.                                                                                                                                                                                                                                                                                 | External — client site QA                                                |
| H10 | <b>Google Business Profile category unverifiable</b> from outside — the #1 local ranking factor. Requires a manual dashboard check ("Website Designer" recommended primary).                                                                                                                                                                                                                                                                                                                                             | GBP dashboard (manual)                                                   |

## Medium-Priority Findings (fix within 1 month)

| #   | Finding                                                                                                                                                                                                                                                                                                                                                       | Evidence / location                               |
|-----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| M1  | Three live, indexed EN slugs with typos / untranslated words: <code>web-design-hotlels</code> , <code>web-design-tour-operadors</code> , <code>web-design-dentistas</code> . Fixing requires slug rename + 301 redirects (infra already exists).                                                                                                              | <code>src/il8n/routing.ts</code><br>~106/122/126  |
| M2  | HTML sitemap pages ( <code>/en/sitemap</code> , <code>/es/mapa-del-sitio</code> ) are <code>noindex</code> , <code>nofollow</code> — nofollow discards the internal-link value of their 109 links each. Use <code>noindex</code> , <code>follow</code> .                                                                                                      | Both locale sitemap pages                         |
| M3  | <code>/en/project-planner</code> + ES twin: indexable, in the sitemap, only 256/265 words, and <b>no H1</b> . Privacy/terms pages also lack H1s (both locales).                                                                                                                                                                                               | Full-crawl heading census                         |
| M4  | Title tags exceed 65 characters on <b>100 pages</b> (85 blog posts; 72 pages >75 chars, max 105) — truncating in SERPs on nearly every post.                                                                                                                                                                                                                  | Full-crawl title census                           |
| M5  | 12 blog pairs where the Spanish FAQ block has 1–2 fewer questions than English (e.g. bilingual-SEO post: EN 5, ES 3) — residue of the closed FAQ-locale gap.                                                                                                                                                                                                  | Full-crawl FAQPage diff                           |
| M6  | robots.txt <code>Disallow: /studio/</code> misses bare <code>/studio</code> (infinite-depth crawlable SPA shell; only meta-noindex protects it). Use <code>Disallow: /studio</code> + <code>X-Robots-Tag</code> backstop.                                                                                                                                     | <code>src/app/robots.ts:17</code>                 |
| M7  | No RD\$ (DOP) price anchoring anywhere — local SERPs anchor on RD\$12,000; site is 100% USD. Add "from \$400 USD (~RD\$24,000)" on pricing + pillar pages.                                                                                                                                                                                                    | All 14 money pages checked                        |
| M8  | Off-site authority gaps: no LinkedIn <i>Company</i> Page, no Facebook/Instagram, no YouTube (strongest AI-citation correlation), GitHub profile doesn't link back to the site, no GoodFirms / Páginas Amarillas RD listings. Reviews lack dates and third-party links; expat.com citation publishes a street address conflicting with the site's NAP posture. | sameAs audit + citation search                    |
| M9  | llms.txt claims "RSL 1.0" licensing with no machine-readable backing ( <code>rel=license</code> / <code>rsl.xml</code> absent). Back it or drop it.                                                                                                                                                                                                           | <code>/llms.txt</code>                            |
| M10 | Locale-negotiated root redirect lacks <code>Vary: Accept-Language</code> ; mobile hamburger tap target is 24×24 px (WCAG AAA / platform guides want 44×44).                                                                                                                                                                                                   | <code>src/middleware.ts</code> ; header component |

## Low Priority / Backlog

- 58/216 sitemap URLs share one fallback `lastmod` (weak freshness resolution — deliberate anti-thrash design, tune per-route).
- Geo coordinates at 4 decimals (spec suggests 5); Santiago missing `sameAs` in `areaServed`.
- Font payload 136 KB (3 woff2) — subsetting opportunity; hero image 7–8 KiB residual compression.
- Case-variant URLs ( `/EN/pricing` ) redirect 307 instead of permanent; HSTS value weaker on apex hop than on www.

- Portfolio `CreativeWork` items lack `image` ; WebPage nodes lack `dateModified` .
- Possible keyword cannibalization: `/diseno-web-republica-dominicana` vs `/desarrollo-web-republica-dominicana` — differentiate angles.
- FAQ questions rendered as `<button><span>` , not semantic headings — fine for schema, weaker for heading-based AI extraction. (FAQ rich results retired for all sites May 2026 — keep markup for AI citation; expect no SERP feature.)

## What's Working Well

- **Rendering & crawlability:** 100% server-rendered content (verified with bot user-agents, no JS); all 216 sitemap URLs return 200 with self-referential canonicals; zero broken hreflang references.
- **Internationalization:** full en/es mirror — word-count parity within 30% on all 108 pairs (ES consistently slightly richer); genuinely translated slugs; localized titles/descriptions throughout; intentional, correctly-implemented Spanish-first defaults (x-default → /es, crawler-safe 308).
- **Sitemap (91/100):** complete hreflang alternates incl. x-default on every URL; no priority/changefreq noise; location-page count (8 cities) well under doorway-page thresholds with ~78% unique phrasing between sampled city pages.
- **Performance:** Lighthouse 90/90/98; CLS ≈ 0 sitewide; every raster image served as AVIF; fonts self-hosted with `font-display: swap`; hero LCP image preloaded with `fetchpriority=high`.
- **AI infrastructure:** well-structured bilingual `llms.txt` + `llms-full` files; AI-search crawlers explicitly allowed while training-only bots (CCBot, anthropic-ai, cohere-ai) are blocked; IndexNow push indexing wired to CMS publishes.
- **Link profile basics:** all 10 client portfolio sites carry live, dofollow "DR Web Studio" credit links; Clutch profile live.
- **Content substance:** blog/case studies are specific and human-authored with real clients and concrete metrics (200% booking conversions, 150% sales growth) — strong raw E-E-A-T material.

## Methodology & Limitations

Ten parallel specialist analyses (technical, content/E-E-A-T, schema, sitemap, performance, visual/mobile, GEO/AI-readiness, SXO, local, backlinks) followed by a scripted full crawl of all 216 sitemap URLs with hand-verified flag sampling. Evidence base: live HTTP responses (curl, bot user-agents), source-code cross-reference of the Next.js/Sanity repo, Lighthouse 13.4 (headless Chromium, simulated mobile), Playwright screenshots (375px/1440px, light+dark), and public web searches.

**Limitations:** Performance figures are single-run lab estimates, not CrUX field data (no Google API key configured; INP is proxied by TBT). Backlink analysis limited to Common Crawl + direct verification (no Moz/DataForSEO). GBP listing data, Trustpilot and Clutch ratings could not be read programmatically (bot-blocked); GBP category requires a manual dashboard check. SERP intent analysis used AI-summarized US-vantage search results, not geo-localized raw SERPs.

## Leading Indicators to Monitor

| Indicator                                                    | Watches                          | Where                             |
|--------------------------------------------------------------|----------------------------------|-----------------------------------|
| Impressions/clicks on EN blog URLs                           | C1 blog schema fix taking effect | Google Search Console             |
| Ranking URL for "freelance web developer dominican republic" | C3 new landing page adoption     | Incognito/gridded search          |
| CSP violation reports going quiet                            | Readiness to enforce CSP (H1)    | Browser console / report endpoint |

|                                         |                                  |                                        |
|-----------------------------------------|----------------------------------|----------------------------------------|
| GBP review count & recency              | Local trust trajectory<br>(47 →) | Google Business Profile                |
| AI answers quoting one consistent price | C2 price reconciliation          | Spot-ask ChatGPT/Perplexity<br>monthly |
