INSIGHTS

▲ Render-blocking requests - Est savings of 450 ms

Requests are blocking the page's initial render, which may delay LCP. [Deferring or inlining](#) can move these network requests out of the critical path. [LCP](#) [FCP](#) [Unscored](#)

URL	Transfer Size	Duration

▲ Forced reflow

A forced reflow occurs when JavaScript queries geometric properties (such as offsetWidth) after styles have been invalidated by a change to the DOM state. This can result in poor performance. [Learn more about forced reflows](#) and possible mitigations. [Unscored](#)

Preconnected origins

preconnect hints help the browser establish a connection earlier in the page load, saving time when the first request for that origin is made. The following are the origins that the page preconnected to.

Origin	Source
https://cdn.sanity.io/	head > link <link rel="preconnect" href="https://cdn.sanity.io" crossorigin="">

Unused preconnect. Only use preconnect for origins that the page is likely to request.

Preconnect candidates

Add preconnect hints to your most important origins, but try to use no more than 4.

No additional origins are good candidates for preconnecting

Improve image delivery — Est savings of 7 KiB

Reducing the download time of images can improve the perceived load time of the page and LCP. [Learn more about optimizing image size](#) LCP

Optimize DOM size

A large DOM can increase the duration of style calculations and layout reflows, impacting page responsiveness. A large DOM will also increase memory usage. [Learn how to avoid an excessive DOM size](#) Unscored
